

ABSTRACT OF THE DISCLOSURE

A folding full length mirror and carry apparatus includes a foldable reflective surface support assembly which includes support panels connected together with panel-interconnection hinges. A non-folded reflective surface assembly is supported by the foldable reflective surface support assembly. Preferably, a handle is connected to the foldable reflective surface support assembly. A shoulder strap can be connected to the foldable reflective surface support assembly. Preferably, a folded condition locking assembly is connected to the foldable reflective surface support assembly for retaining the apparatus in a folded up, carrying condition. With one embodiment of the invention, the non-folded reflective surface assembly includes panel-mounted non-folded reflective surfaces mounted one side of each of the respective support panels. With another embodiment of the invention, the reflective surface assembly includes a reflective rollable non-folded sheet wound on a roller assembly supported by the foldable reflective surface support assembly.
